Florida Estuarine Restoration Database Metadata

Note: References to tables and supplementary tables within variable descriptions refer to the corresponding tables in the *Nature Scientific Data* Data Descriptor publication describing the Florida Estuarine Restoration Database. The publication will be linked to this dataset record once available.

Variable Name	Description
Master_Project_ID	Unique identifier assigned to each project in the database. A project is defined as a distinct restoration effort, while a record represents all or part of a project. The Master_Project_ID is the final project-level identifier used throughout the database, meaning that all records associated with the same restoration project share a common Master_Project_ID, regardless of whether the project is represented by a single record or multiple records.
Original_Project_ID	Unique identifier for each record formally assigned by original data source (see Supplemental Table 1 for more detailed information).
Merged_Record_ID	Unique identifier linking project records merged across multiple data sources. Formatted as 'OriginalProjectID_DataSource_OriginalProjectID_DataSource2', where DataSource represents the primary record source and DataSource2 represents the merged record source. OriginalProjectID refers to the original project identifier from each respective database.
Project_Group_ID	Unique identifier linking records that have different quantitative restoration metrics either across multiple locations and/or different restoration habitats (e.g., a restoration project involves constructing an oyster reef breakwater and creating an intertidal salt marsh habitat, and quantitative metrics were calculated for each distinct habitat type).
Data_Source	Original data source from which project information was obtained (see Table 1 for dataset codes). If duplicate records were merged across data sources, this field identifies the primary source record retained in the database.
Data_Source_2	Additional data source containing the same project record that was merged with the primary record identified in Data_Source.
Project_Name	Restoration project name reported by the original data source.
Project_Description	Restoration project description reported by the original data source.
Project_Status	Current project status reported by the original data source. Original status values were standardized into the following categories: Active, Completed, Monitoring/O&M, Planning, and NA. These categories are not mutually exclusive (e.g., Monitoring/O&M may indicate a completed restoration project undergoing long-term monitoring or maintenance). Users are encouraged to consult the project URL or contact the lead implementing organization to verify the most current project status.
Start_Year	Year the project was initiated, funded, or awarded, based on information available from the original data source.

Variable Name	Description
Completion_Year	Year the given record was completed as reported by the original data source.
Project_Completion_Year	The most recent completion year reported across all records of a given project. A given project may contain multiple records with different completion years, representing restoration activities completed across different habitats or phases as the project progresses. Therefore, a completion year value may be associated with projects with a Project_Status of Active or Monitoring/O&M in addition to Completed, as individual restoration actions may be completed while other project components remain ongoing.
Exp_Completion_Year	Expected project completion year provided by the original data source when a final completion year was not available.
Habitat_Description	Brief description of the habitat being restored by the original data source.
Habitat_Type	Standardized habitat classification developed for the Florida Estuarine Restoration database. Reference Table 2 for the list of categories and examples of source terms assigned to each.
Project_n_Habitat_Types	Number of unique habitat types targeted for a given project.
Restoration_Technique	Standardized restoration technique classification developed for the Florida Estuarine Restoration database. Reference Table 2 for the list of categories and examples of source terms assigned to each.
Acres_Restored	Total area restored and or created as reported by the original data source for a given record.
Acres_Protected	Total area protected or preserved as reported by the original data source for a given record.
Miles_Restored	Total linear distance restored and or created as reported by the original data source for a given record.
Miles_Protected	Total linear distance protected or preserved as reported by the original data source for a given record.
Project_Acres_Restored	Sum of total area restored and or created as reported by the original data source across all records for a given project. Represents a project-level value.
Project_Acres_Protected	Sum of total area protected or preserved as reported by the original data source across all records for a given project. Represents a project-level value.
Project_Miles_Restored	Sum of total linear distance restored and or created as reported by the original data source across all records for a given project. Represents a project-level value.
Project_Miles_Protected	Sum of total linear distance protected or preserved as reported by the original data source across all records for a given project. Represents a project-level value.
Acres_Restored_Category	Standardize size classification of total acres restored and or created, as reported by the original data source for a given record. Categories include: Less than 1, 1 - 5, 5 - 50, 50 or more.
Miles_Restored_Category	Standardized size classification of total linear distance restored and or

Variable Name	Description
	created, as reported by the original data source for a given record. Categories include: Less than 1, 1 - 5, 5 or more.
Project_Acres_Restored_Category	Standardize size classification of total acres restored and or created, as reported by the original data source for a given project. Categories include: Less than 1, 1 - 5, 5 - 50, 50 or more.
Project_Miles_Restored_Category	Standardized size classification of total linear distance restored and or created, as reported by the original data source for a given project. Categories include: Less than 1, 1 - 5, 5 or more.
Debris_Removed	Total amount of debris removed (in tons)
Species_Benefited	Targeted species expected to directly benefit from project implementation, as identified by the original data source. This does not include invasive species that are targeted for removal.
Socioeconomic_Jobs_Created	Total estimated jobs created by the project as reported by the original data source, including direct, indirect, and induced jobs.
Socioeconomic_Avoided_Travel_Losses	Avoided travel time losses (USD) by a given restoration project as reported by the original data source, summed across auto and rail avoided travel time losses.
Socioeconomic_Avoided_Damage_Losses	Avoided property damage and reduced repairs (USD) by a given restoration project as reported by the original data source, summed across commercial and residential.
Socioeconomic_Properties_Benefited	Total number of properties benefitted from enhanced protection as reported by the original data source, summed across commercial, residential, public and critical infrastructure.
Reported_Project_Cost	Reported or source-derived cost of the restoration project based on funding or expenditure information available from the original data source, including funding authority amount funds when applicable. When both budgeted and actual expenditures were available from the original data source, actual expenditures were recorded. Otherwise, the reported value represents the budgeted or awarded funding amount. The value may not represent the final or total project cost if additional funding information was unavailable or incompletely reported.
Main_Funding_Source	Primary funding source or funding administrator for the project as identified by the original data source. If multiple entities are listed by the original data source, the main funding source is the entity reported as providing over 50% of the funding for the given project.
Main_Funding_Source_Category	Standardized categorical classification of primary source of funding for the project, based on the funding entity, program, or mechanism identified by the original data source. Categories were assigned according to the classification shown in Table 3, which provides the list of categories and examples of source terms assigned to each. This classification does not reflect tracing funding beyond the primary funding source identified by the original data source.
Funding_Program	Funding program through which project funds were distributed or administered as identified by the original data source. Programs may be associated with a broader funding source, legislation, or legal

Variable Name	Description
	settlement.
Lead_Implementer	Primary organization or agency responsible for implementing the project, as identified by the original data source.
Lead_Implementer_Category	Standardized categorical classification of the primary source responsible for implementing the project, as identified by the original data source. Categories were assigned according to the classification shown in Table 3, which provides the list of categories and examples of source terms assigned to each.
Partners	Other organizations, agencies or entities involved in the project as reported by the original data source.
Latitude	Latitude coordinate of the project location reported by the original data source.
Longitude	Longitude coordinate of the project location reported by the original data source.
County	Associated county in Florida where restoration project was conducted. See section 4.3.5 for classification methodology when the county was either not originally reported by the original data source or when multiple counties were reported.
County_Multiple	List of counties originally reported by the original data source if the data source listed more than one county (e.g., a project occurred across multiple areas in a bay that was separated into multiple counties).
EDA	Associated estuarine drainage area where restoration project was conducted.
Project_URL	Reference URL for project documentation, if provided by original data source.
Point_of_Contact_Email	General contact email associated with the original organization, program or database. Provided when available and intended for inquiries regarding project records.
FWC Grant	Florida Fish and Wildlife grant number associated with the project.
Federal Grant	Federal grant number associated with the project.
NEP_Name	Original categorical classification from the NEP data source describing the associated estuary program for the project. This variable is currently only provided for NEP sourced projects.
NEP_Activity_Name	Original categorical classification from the NEP data source describing whether the activity was restoration, preservation, or maintenance. This variable is currently only provided for NEP projects.
Manual_Recode	Binary flag indicating whether the record was manually recoded for either the variables Habitat_Type or Restoration Technique (1 = Yes, 0 = No). See section 4.3.3 for additional information.
County_GIS	Binary flag indicating whether the record was assigned a value for the variable County using spatial coordinates (1 = Yes, 0 = No).
